

**Sure Check 21 has Many Benefits ...
But Do You Know Your Risks?**

Be Safe with Smart Track!

Smart Track™ is the Safety Net for Check 21 Processing

Traditional two-pass check processing inherently provided a safety net to catch unprocessed checks. On some occasions, a batch of checks would be left over after pass two. This alerted you to a processing error. Regardless, the left over batch was the safety net that signaled an error occurred.

With Check 21 one-pass processing, that safety net is gone - there is no physical pass two. But now, Smart Track™ re-enables the safety net for Check 21 processing and much more. Batches are continuously tracked from receipt to shred. Batches are now auditable and controlled. Unprocessed batches are automatically detected and alerts created. The concerns about double-posted checks, lost batches, or mistakenly shredded checks are eliminated.

The screenshot shows the MavBridge Smart Track (Storage Station #1) interface. It includes a menu bar with 'Logout', 'Controls', and 'Item Tracking'. Below the menu is a toolbar with buttons for 'Item Query', 'Process Query', 'Alert Query', 'Create', 'Move', and 'Finalize'. The main area displays 'Item Detail Settings' for 'batch.000009917' with a 'Lookup' button and a 'Tracking Stream' dropdown set to 'Physical Tracking'. A 'Processing History' table is shown below, and at the bottom are 'Alerts...' and 'Print' buttons. The status bar indicates 'Connected (Fred White)'.

Callout boxes provide the following information:

- Know the exact status of every process. Know which batches are ready for scanning and which are scheduled for shredding.
- Check to see if a batch has an associated alert. If the batch contains rejects, the alert will display images of the items that must be pulled.
- Create a starting point for batch tracking - either automatically during scanning or while prepping a batch.
- Move batches from location to location while recording complete tracking information for reporting and auditing.
- Ensure that batches about to be shredded have been fully processed. Finalize and shred batches at exactly the right time.
- View the history of any batch. Know when it was created, where it's been, and who has it checked out.

Security

Each batch is constantly tracked and double checked as it passes through electronic processes and physical locations. You know precisely where each batch has been and for how long. Ensure each check is processed on time so that you can meet the strictest internal compliance and auditing requirements.

Control

Proactive e-mail alerts are sent as soon as any warning or error is detected. With real-time status on whether a batch of checks is in the wrong location or about to be erroneously shredded, Smart Track lets you know.

Flexibility

Monitor containers and shelf locations. No matter how you choose to store your checks, Smart Track is flexible enough to adapt. Smart Track helps you pull rejected items efficiently.
